Deck Tile Installation Instructions

Getting Started
Deck Tiles are easy and fast to install without the use of tools. They are ready for immediate outdoor use and can be installed directly on top of a hard level surface. For best results, install directly over existing, level concrete surfaces or existing decking. Some movement between tiles is necessary to ensure easy installation.

Step 1:
Plan the layout. Measure the area that will be covered. Each box contains six 12in. x 12in. deck tiles covering an area of roughly six square feet. For example, a standard 12ft. by 16ft. deck surface (192 sq. ft.) would require approximately 32 boxes.

Step 2:
Thoroughly clean the existing surface before laying the deck tiles.

Step 3:
Choose a starting point for installation - it is recommended to begin by placing one tile in a corner.

Step 4:
Continue building outward by connecting each tile together in the desired pattern and shape. Tiles connect to one another by placing the connecting pegs from the bottom edge of a tile into the connecting loops on the bottom edge of another tile.

Step 5:
If cutting is desired, remove screws that are close to a cut line prior to cutting. Use a jigsaw or circular saw with a sharp carbide blade to cut and trim tiles to fit any remaining space until the desired surface is covered. This can also be done to trim off unused plastic connecting loops from the edge of the tile.
